

Purification

Silica-based Flash Cartridges, Bulk Materials & LC Columns

- Available in different selectivities
- Dedicated 300 Å wide pore materials
- Particle size from 5 µm to 50 µm
- Flash cartridges from 4 g to 3 kg
- LC Columns from 4.6 mm to 50.0 mm ID
- Compatible with all instruments on the market

Features

BGB Flash Cartridges are ultra-pure silica-based flash cartridges with tight particle size distribution and high surface area. Available in 50 µm, 30 µm and 15 µm particle size for difficult separation. Pressure-rated up to 27.5 bar (400 psi) for high flow rate and fast purification. Reduction of purification time by 40-60 %. More concentrated fractions for easy evaporation and less solvent consumption.

- 100 % guaranteed leak-free.
- Body in pharmaceutical-grade polypropylene.
- Closed-top spin-welded technology for standard hardware sizes. Pressure up to 27.5bar (400 psi).
- Possibility of working at high flow rates for fast purifications.
- Also available in 800 g, 1.6 kg and 3kg formats.
- Luer and/or luer-lock connection for standard hardware types.
- Packed with ultra-pure silica-based material.
- Available in Silica (Si), C18, C8, C4, Cyano (CN), Diol (OH), Amino (NH₂) and HILIC-D
- Dedicated 300 Å wide pore spherical materials in C18, C8 and C4 for peptides and proteins purification.
- Excellent lot-to-lot reproducibility.

Compatibility

BGB Flash Cartridges are compatible with all instruments on the market: Agela, Analogix, Armen Instrument, Biotage, Büchi, ECOM, GEÄKTA, Gilson, Grace, Interchim Puriflash, Teledyne Isco, Yamazen, Santai SepaBean, etc.

Different adapters are available. Please refer to www.bgb-shop.com/luer-adapters.

Pressure limit

BGB Flash Cartridges use a spin-welded technology that makes it possible to use the column up to 27.5 bar (400 psi) depending on column size. Please refer to the maximum pressure specified on each column and never exceed this value (for details check tables on page 4 and 5).

Easy-Multi-Luer Outlet

BGB Flash Cartridges in hardware W004 to W330 have a female luer-lock inlet and an Easy-Multi-Luer outlet (figure 2). To get a male luer tip, just remove the orange plug by pulling it down (figure 1). To have a luer-lock connection, simply unscrew the luer fitting by using the orange plug as a tool (figure 3).

Basic Information

Report Sheet

All boxes of BGB Flash Cartridges contain a report sheet. Every lot of filling material is tested to ensure good lot-to-lot reproducibility and the highest quality standard.

Label

Each BGB Flash Cartridge comes with a label including a full description of the phase with lot number and indicating the best parameters for column use as flow rate, maximum pressure and sample loading (figure 4).

Storage before use

Before use, store the cartridges in a dry place, away from light and dust, and at room temperature. The orange plugs must not be removed before the first use.

Conditioning

This stage is crucial to achieve the maximum performance of your column. It activates the silica and removes the air from the cartridge. For optimum purification, this step must be performed prior to the sample load. Rinse the column with 3 to 5 column volumes depending on the phase and the column size. Generally, the solvent (or mixture of solvents) for this step is the one used at the beginning of the purification.

BE CAREFUL, and note that the use of a strong eluent for the conditioning will result in poor separation because of the high affinity of the solvent for the compounds to be purified. Depending of the solvent (or mixture of solvents) used, a normal heating phenomena can appear during this stage. To minimize this effect, and avoid a too much temperature increase, we strongly recommend to be at the lowest part of the flow rate range mentioned on the column. Drying the cartridge after the conditioning step will also result in a loss of column performance.

Storage after use

Normal phase silica and alumina cartridges are single use columns and should not be stored or re-used. For the bonded phases C18, C8, C4, Cyano (CN), Diol (OH), Amino (NH₂) and HILIC please refer to the table below. Please note that the orange plugs at the inlet and at the outlet of the cartridge must always be in place to avoid solvent evaporation.

Adapters for Large-Scale Cartridges

Adapters for S0800, S1600 and S3000 Flash Column Hardware

Stainless-Steel
adapter for
inlet port

PEEK
adapter for
outlet port

These adapters (stainless-steel luer-lock inlet and PEEK luer outlet) have to be used with BGB column hardware S800, S1600 and S3000 (please see page 5). They can be connected to any kind of luer connection.

Luer-lock inlet: The stainless-steel inlet adapter is designed with a thread on half of the length and a smooth part on the other half. The thread is supposed to fit into the plastic when you screw in (figure 6). You have to screw it until the smooth part is engaged a few millimeters deep to insure a truly leak-free connection (figure 7).

This can be installed by hand and needs to be screwed in manually.

Luer outlet: The PEEK outlet adapter has to be firmly inserted into the column outlet to insure a truly leak-free connection (figure 9).

Analytical & Preparative HPLC columns

BGB Analytical & Preparative HPLC columns have been designed to offer you the easiest way to develop your reversed phase methods and to scale-up your purifications with strictly the same material in term of stationary phase, particle size and pore size. All bonded phases are available in classical stainless steel analytical HPLC columns (4.6 x 150 mm and 4.6 x 250 mm), preparative HPLC columns (I.D. from 21.2 to 50 mm) and plastic flash cartridges (4g to 3 kg of phase) to offer you a large choice of possibilities in term of development and scale-up.

Because of the use of standard 10-32 fittings, BGB HPLC columns are compatible with all HPLC systems on the market.

Features include

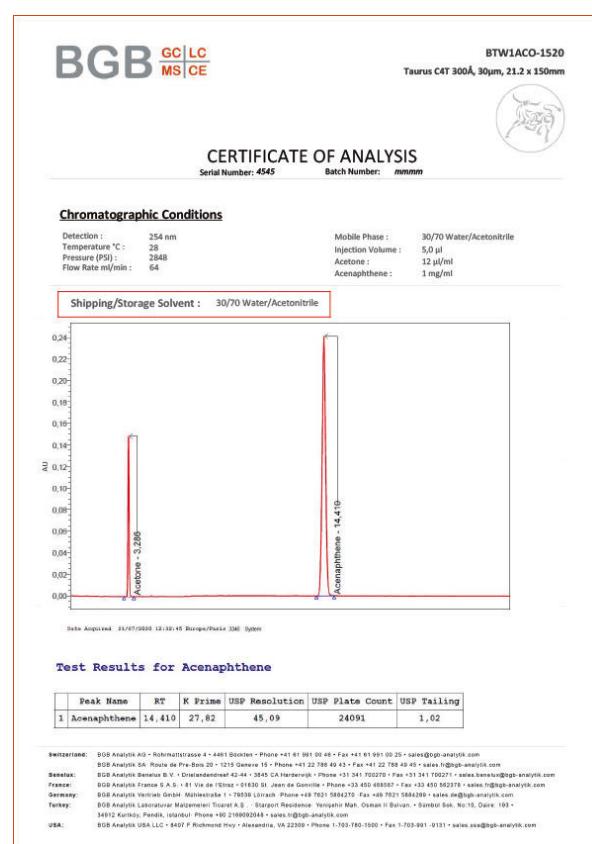

- High quality SS analytical columns with dimensions of 4.6 x 150 mm and/or 4.6 x 250 mm.
- Preparative HPLC columns with I.D. from 21.2 mm to 50.0 mm.
- Strictly similar bonded phases as those used for our flash cartridges for easy scale-up.
- Available in Scorpius C18, Aquarius C18AQ, Taurus C18T, Taurus C8T and Taurus C4T.
- Dedicated Taurus 300 Å wide pore materials for peptides and proteins purification.
- Particle size of 5 µm, 10 µm, 15 µm and 30 µm.
- Compatible with all HPLC systems on the market.

Column certificate

All BGB HPLC columns are individually tested to ensure a high quality and reproducibility from column to column and lot to lot. Each column is delivered with its own analysis report and wear a sticker indicating part number, column type, dimensions, serial number and flow direction.

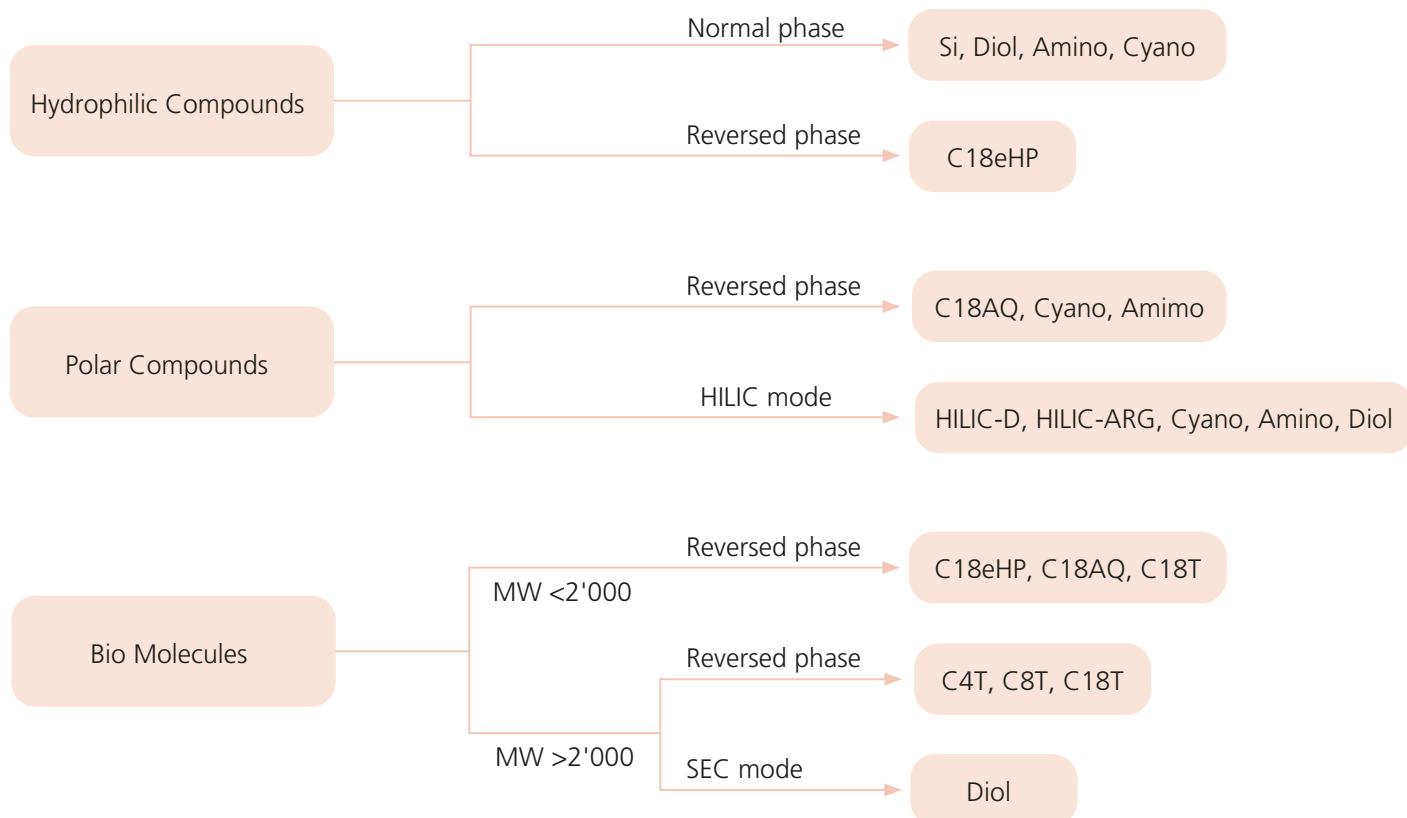

Bulk material

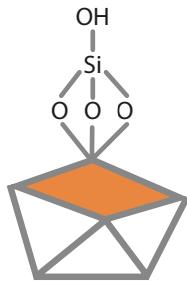

Additionally to our HPLC columns and our flash cartridges, BGB Analytik proposes also the possibility to order the spherical bulk materials bonded phases for Scorpius C18, Aquarius C18AQ, Taurus C18T, Taurus C8T and Taurus C4T. In boxes of 100g or 1kg, all these phases are available in 5 µm, 10 µm, 15 µm or 30 µm particle size. Combined with our empty flash cartridge portfolio, it offers you the possibility to pack your own column or to have the right phase to make your dry load. It allows you also the possibility to pack your own preparative columns with all self-packing instruments available on the market.

Features

BGB EZPack empty Flash Cartridges offer users convenience for self column packing but are also suitable for solid injection. In case of miscibility problems of compounds, this technic, also called dry load, is commonly used by chemists.

As for the complete range of BGB Flash Cartridges, BGB EZPack empty Flash Cartridges are done with an extra wall thickness. Reinforced body allows to work safely at higher pressure and ensure that the column is able to withstand the pressure capability of modern flash systems.

- Body in pharmaceutical-grade polypropylene
- Reinforced cartridge, pressure up to 13.8 bar (200 psi)
- Luer/Luer Lock connectors are compatible with most flash chromatography systems
- Flexible sample loading

BGB Tips & Tricks

How to fill a BGB EZPack empty flash cartridge

Select the adapted size

Add the loaded silica

If needed, add additional
silica, Celite or sand to reach the
screw thread

Insert the top frit

Use the appropriate frit insertion
tool to place the frit correctly

Add the o-ring

Screw cap until contact
with the filter

NB: During packing, tap gently the cartridge to help silica to settle. When screwing the cap, do not screw too strongly. Just screw until contact with the frit. Start elution with 100 % non-eluting solvent, for 1 minute, to wet the dry loading without eluting the compounds.

How to prepare a dry load

To prepare your dry load, dissolve first your sample in a very good solvent in a quantity of 10ml of solvent by g of compound. Add then a quantity of silica in a ratio of 2 g of silica by g of product. Mix and evaporate the solvent with a rotatory evaporator. The loaded silica must not be sticky.

BGB Tips & Tricks

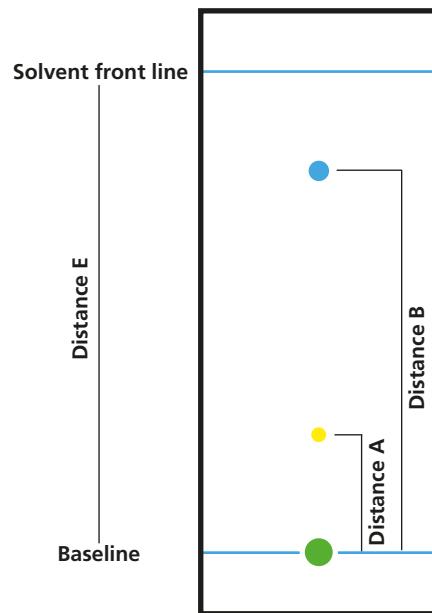

How to calculate the retention factor Rf from a TLC plate:

The retention factor Rf can be easily calculated directly from a TLC plate. After the separation is completed, individual compounds appear as spots separated vertically. Each spot A and B has a retention factor (Rf_A and Rf_B) which is equal to the distance migrated (Distance A and Distance B) over the total distance covered by the eluent (Distance E).

The formula is : $Rf = \text{distance traveled by sample} / \text{distance traveled by eluent}$

$$Rf_A = \text{Distance A} / \text{Distance E}$$

$$Rf_B = \text{Distance B} / \text{Distance E}$$

How to determine solvent composition in normal phase

In TLC (Thin Layer Chromatography), elution conditions are chosen to obtain a retention factor (Rf) of the products between $Rf = 0.1$ and 0.8 with ideally a Rf of 0.15 – 0.2 for the product of interest. In flash chromatography, we can consider a good elution is obtained when the product of interest elutes with 7 to 10 column volumes. Note also, that in flash chromatography, we will always use fewer eluting conditions than the ones determined in TLC in order to better use the properties of the solvents and the silica. It is important to know that the separation on the flash cartridge will be better than those in TLC because of the bed length and so, the efficiency of the cartridge compare to a TLC plate. With this in mind, we can propose the following formula in a first approximation to determine the conditions to apply in flash chromatography.

%TLC =	% of the polar solvent used in TLC
Rf =	Retention factor of the product of interest in TLC
%Flash =	% of the polar solvent to be used in flash chromatography
CV =	column volume in ml
F =	flow rate in ml/min

Isocratic Mode

$$\% \text{Flash} = \% \text{TLC} / (8 \times Rf)$$

Example:

If your product in TLC is eluting with a $Rf = 0.2$ with 20% of polar solvent, the % of polar solvent to use in flash chromatography is: $\% \text{Flash} = 20 / (8 \times 0.2) = 12.5\%$. So, the use of 12–13% of polar solvent should result in a good separation in flash.

Gradient Mode

In a first time you can use the bi-exponential gradient below:

$t = 0$	$\% \text{Flash} = 0$
$t = 5CV/F$	$\% \text{Flash} = 0.2 \times \% \text{TLC} / Rf$
$t = 20CV/F$	$\% \text{Flash} = 100$

Note : With methanol as eluent, the product might elute quite faster than expected on the TLC plate. It is recommended to divide by half the % of methanol after to have apply formula described above.
