

Interchim HTHR

High Throughput. High Resolution.

Strategy™ UPLC and HPLC columns

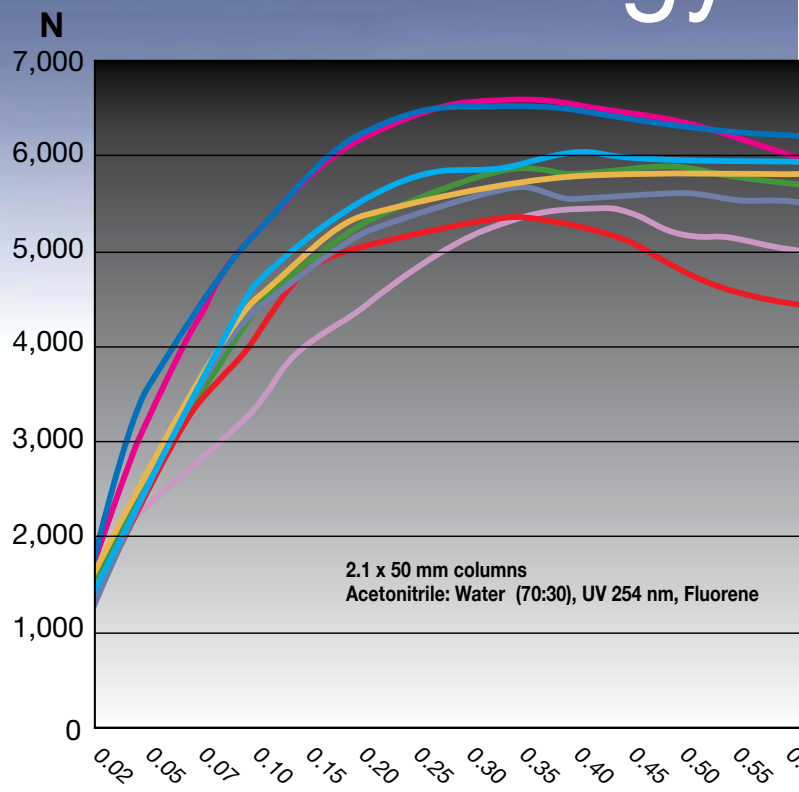

Interchim Strategy™

Strategy columns redefine the boundaries for high throughput analysis by maximizing resolution without sacrificing speed.

The enhanced performance and low back pressure is a result of phase features, a revolutionary packing process and the cylindrical pore structure of the base silica.

Offered in eight phases the Strategy 1.7 μ and 2.2 μ columns are suitable for a wide range of polar, mid-polar and non-polar compounds. The low surface energy ensures peak symmetry for even the most basic compounds.

The well hydroxylated surface and high surface area (425m²/g) maximizes the loading capacity and provides excellent pH stability from 1 to 10.

Compared to the competition, Strategy maintains high separation efficiency for high throughput analysis.

- Strategy 1.7 μ C18-2
- Competitor A, 1.7 μ C18
- Strategy 2.2 μ C18-2
- Competitor B, 1.8 μ C18
- Strategy 2.2 μ NEC
- Competitor C, 1.8 μ C18
- Strategy 2.2 μ PRO
- Competitor D, 1.8 μ C18

Strategy: 1.7 μ C18-2, 4.6 x 50 mm				Strategy: 2.2 μ C18-2, 4.6 x 50 mm

Acetonitrile: Water (70:30), UV 254 nm, 22C, Fluorene

HTHR

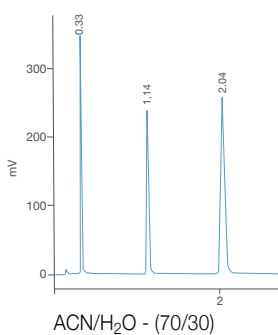

– High Throughput. High Resolution. UPLC and

200,000 plates/m, 2900 psi

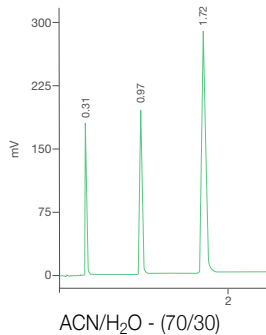

Strategy columns exhibit high permeability that allow higher flow rates compared to other ~2 μ columns. High pressure benefits are realized and the analysis can be performed at high flow rates without compromising the separation.

Uptisphere® Strategy:
 2.2 μ m C18-2, 50 x 4.6 mm
Part Number: XA3980
Flow: 1.3 ml/min
Pressure: 84 bar/1218 psi
Plates/col : 9332

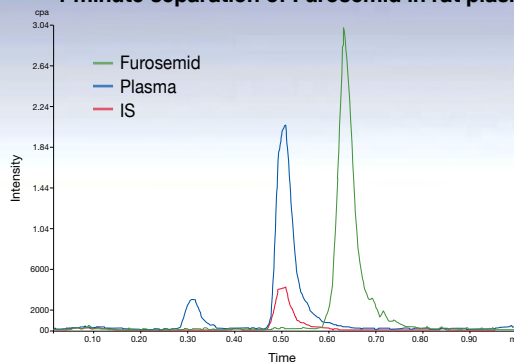

Fluorene
 Tr: 2.04 min
 As: 1.12

Uptisphere® Strategy:
 1.7 μ m C18-2, 50 x 4.6 mm
Part Number: XA3860
Flow: 1.5 ml/min
Pressure: 201 bar/2915 psi
Plates/col : 10825

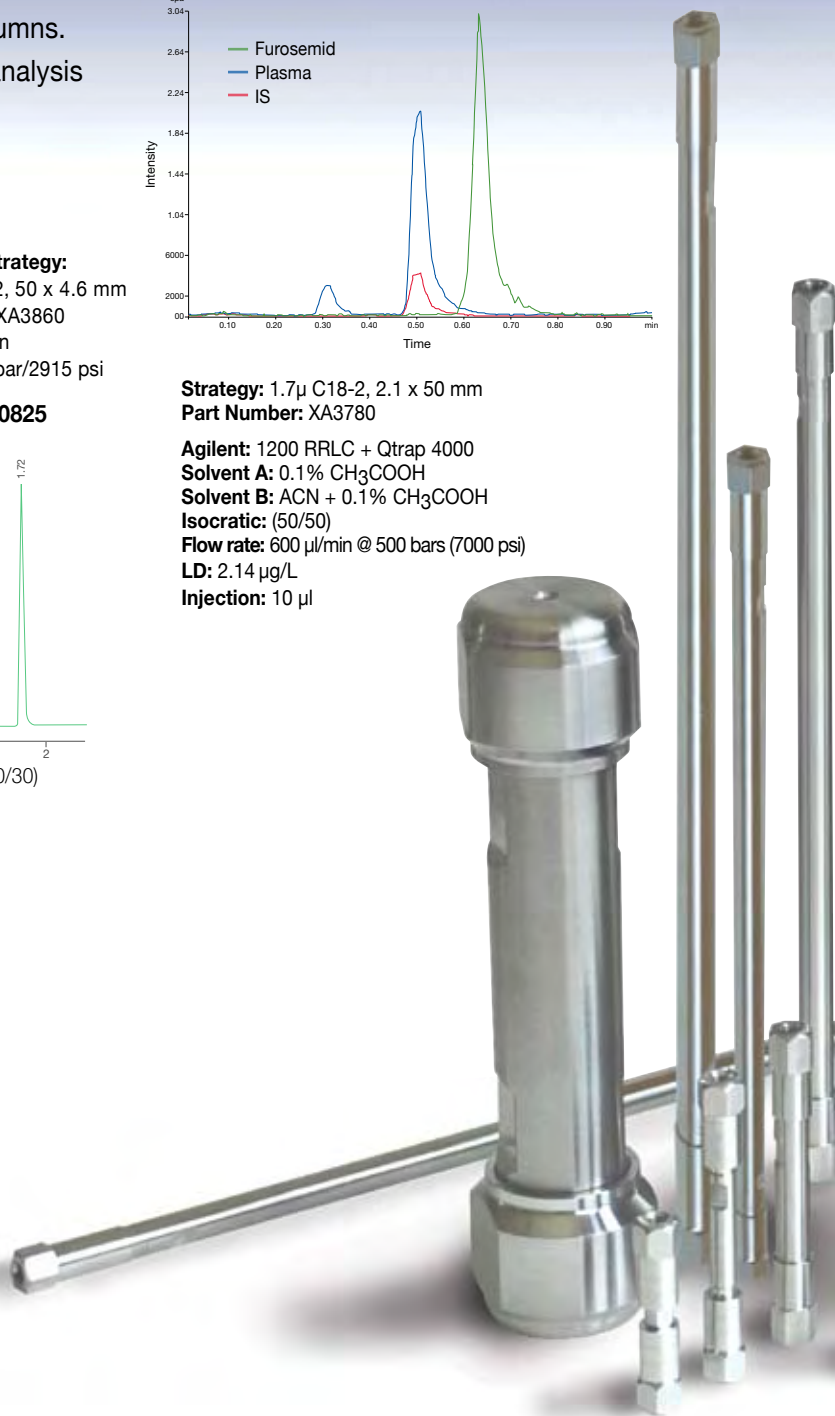

Fluorene
 Tr: 1.72 min
 As: 1.23

1 minute separation of Furosemid in rat plasma

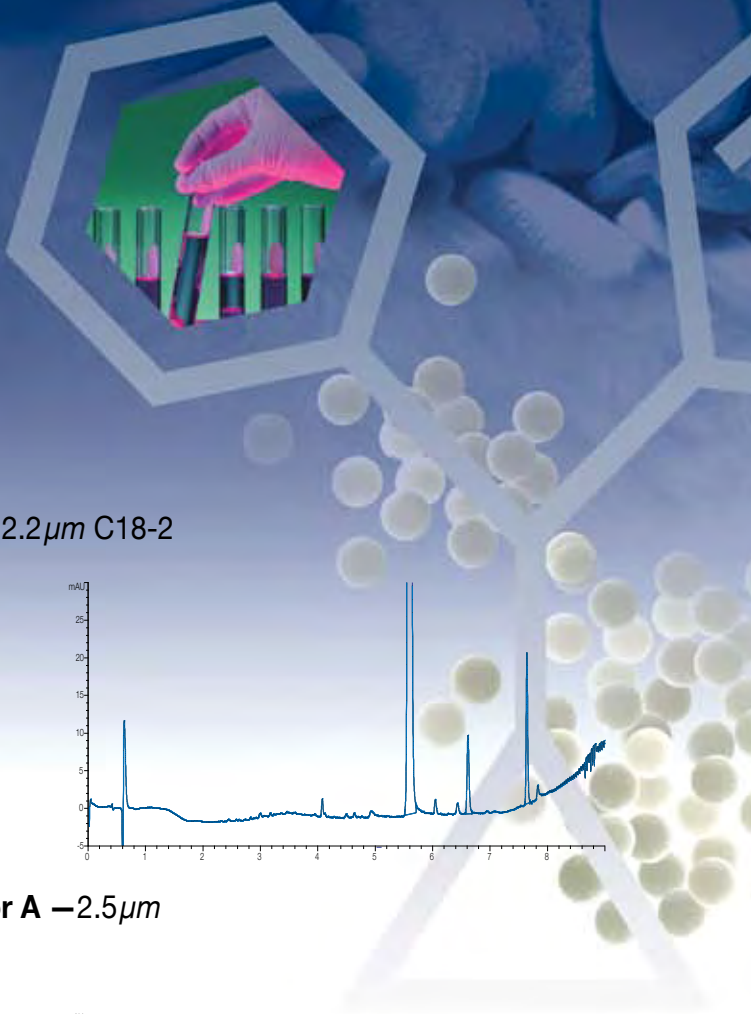

Strategy: 1.7 μ C18-2, 2.1 x 50 mm
Part Number: XA3780

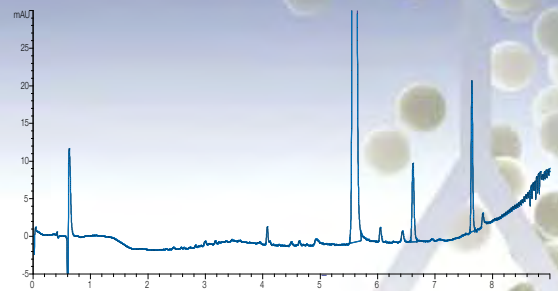

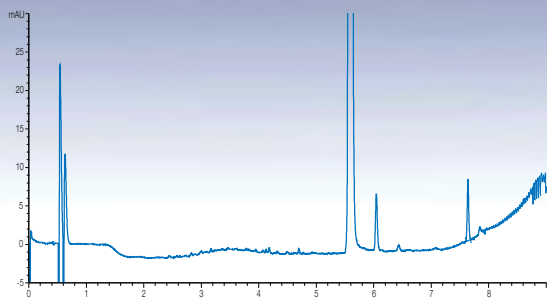

Agilent: 1200 RRLC + Qtrap 4000
Solvent A: 0.1% CH₃COOH
Solvent B: ACN + 0.1% CH₃COOH
Isocratic: (50/50)
Flow rate: 600 μ l/min @ 500 bars (7000 psi)
LD: 2.14 μ g/L
Injection: 10 μ l

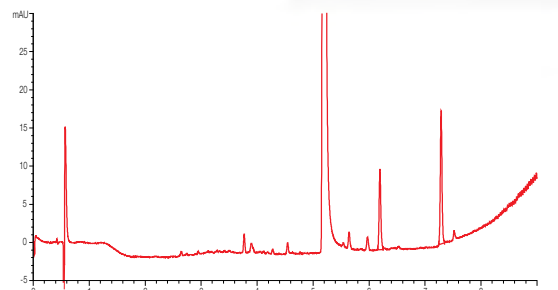

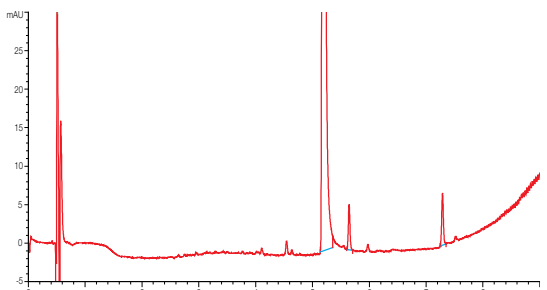

HPLC.

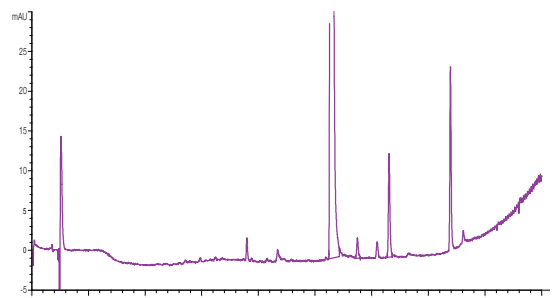

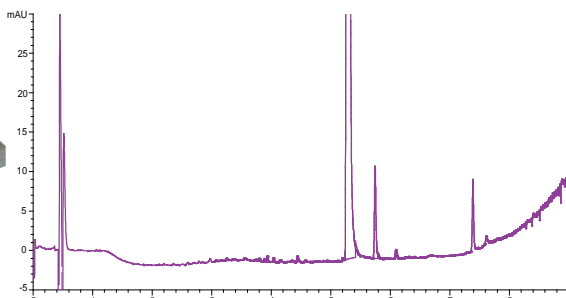

Strategy — 2.2 μm C18-2

Competitor A — 2.5 μm

Competitor B — 1.8 μm

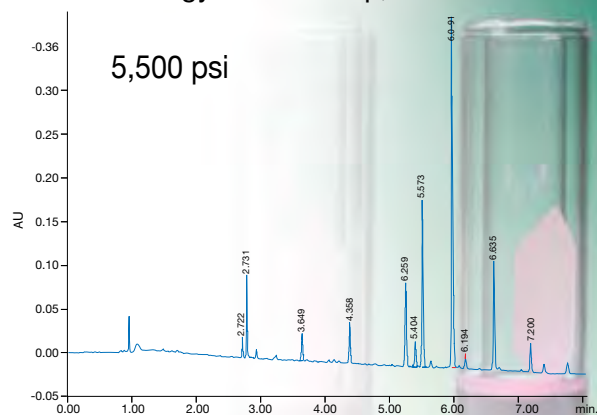

Eluent:
A: 10mM NH_4HCO_3 (pH10)
B: MeCN
Gradient:
A/B 95/05 (lin. grad. 6 min)
A/B 50/50 (lin. grad. 2 min)
A/B 05/95 (1 min)
Flow: 1.25 ml/min
Columns : 50 x 4, 6 mm

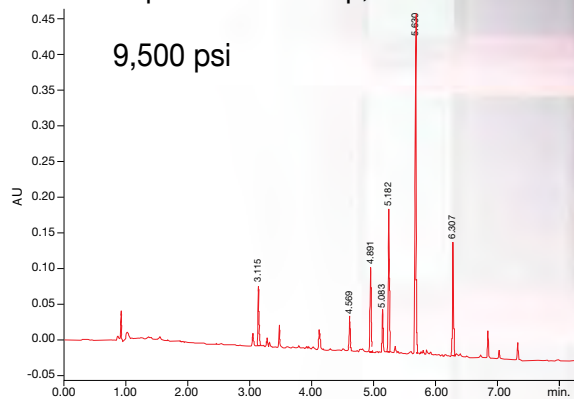

Customer Notes :

“Better selectivity for mid-polar and non polar compounds, Good symmetry, interesting to obtain same results with 1.7 μm and 2.2 μm ”

Strategy C18-2: 2.2 μm , 2.1 x 150 mm

Competitor C18: 1.7 μm , 2.1 x 150 mm

Interchim HTHR

Strategy is offered in eight phases to provide a wide range of selectivity

Phase	Pore Size	Surface Area	Surface chemistry	% C	pH range	Application
C18-2	100 Å	425 m ² /g	C18	19%	1 - 10	General purpose reverse phase, mid to non-polar compounds.
NEC	100 Å	425 m ² /g	C18	18%	1.5 - 7	Strongly retains polar and mid-polar compounds.
PLP	100 Å	425 m ² /g	Alkyl chain w/ polar embedded group	14%	2.5 - 7.5	High aqueous mobile phase with basic and polar compounds.
PRO	100 Å	425 m ² /g	C12	16%	1.5 - 8	Non polar compounds. Less retentive than C18 with greater capacity.
RPX	100 Å	425 m ² /g	Proprietary, reverse phase	-	1.5 - 7	Mid polar and non polar compounds. Less retentive than C18.
HILIC	100 Å	450 m ² /g	Proprietary, reverse phase	NA	1.5 - 7	Ideal for highly polar and basic compounds which do not retain well in RP.
SI	100 Å	425 m ² /g	Virgin silica	NA	1.5 - 7	Non-ionic, polar organic compounds.
NH2	100 Å	425 m ² /g	NH ₂	4%	1.5 - 7	Carbohydrates, polar organic compounds and organic acids.
